As of 2019, the desktop version of AutoCAD was released for Windows, macOS, and Linux. A version is also available for iOS and Android devices. AutoCAD 2015 is available as a cloud service. Use as a teaching tool AutoCAD is used by designers to create drawings of any kind, from architectural plans to household wiring diagrams. AutoCAD is also used by CAD operators to prepare documents and drawings for use by other operators. There are no published standards for the design and documentation of buildings and infrastructure (e.g. pipelines, water supply systems, power systems, rail systems, bridges, etc.). AutoCAD can be used to automate the creation and documentation of any of these. AutoCAD is a collaborative software, where the user can work on a drawing, and at the same time others may view the drawing, make annotations, and make changes to the drawing. AutoCAD is a powerful and reliable design software for architectural and engineering professionals. In addition to architectural plans, AutoCAD is used by many design professionals in a wide variety of professions. In the following sections, we explore in more detail, the use of AutoCAD for designing a different type of building—a tall building—a skyscraper. Designing tall buildings Like other CAD software packages, AutoCAD is used by architects, structural engineers, and interior designers to create designs for buildings. Architects can use AutoCAD to create building designs using the G-codes, for example. They can use a program such as AutoCAD to design a set of plans, elevations, sections, and detailed drawings of a building. Structural engineers can use AutoCAD to design the steel frames of a building. For design of large buildings, AutoCAD is a popular choice, as its uses allow a designer to use computers to create a variety of components that are then assembled into a finished structure. The layers in the application are used for different types of work that has to be done on the building design—for example, architectural design, structural design, engineering, etc. For designing tall buildings, the Windows application can provide additional features, such as floor plan visualization, underground design, etc. For example, if the plan of a building is projected, the application can draw the appropriate sections or elevations to make the drawings clear. I have a Student object and a CustomClass object. I want to output a list of all the properties from the CustomClass object for each student in the list. A: You can use the accessors that's automatically generated by Laravel to map the methods to your Student model. But there is not any other possibility to access the properties of your CustomClass. I think the best solution is to save the list of CustomClass properties to a database, and then load them from the database. In your Student model: use CustomClass; public function getCustomClasses() { return \$this->mapCustomClassProperties(); } private function mapCustomClassProperties() { \$properties = CustomClass::pluck('propertyName', 'id')->all(); return \$properties; } And then in your controller: \$customClasses = \$student->getCustomClasses(); foreach(\$customClasses as \$customClass) { echo \$customClass->propertyName; } APPLICANT'S ABSTRACT: While much
