AutoCAD Features By looking at the other entries in the CAD Field Guide, you can see that there are many features unique to AutoCAD. I've listed the features here in no particular order: Graphical User Interface AutoCAD, like many other CAD programs, has a graphical user interface (GUI). In order to move data objects, draw lines, and create simple and complex drawings, you must choose commands from the menus and toolbars at the top of the screen. Graphical User Interface There are several ways to start using AutoCAD. You can start the program from the desktop, open a drawing file, and choose to open it in your current editing session, or you can start with a new drawing file and choose to create a new editing session. Graphical User Interface When you start, you are given the following information: You are also presented with the following information: There is a Help menu with many resources, but, for most users, the AutoCAD Help window is a good place to start: For step-by-step tutorials and troubleshooting guides, download one of the free trial versions of the program, create a drawing, and click the "Tutorial" button: Menus and Toolbars In addition to starting from the desktop or a drawing, you can start AutoCAD by choosing to open an existing drawing or create a new one. You'll notice a few small buttons at the top of the screen when you first start the program. The "New" button starts you off with a blank drawing, the "Open" button starts you with a default drawing, and the "Help" button displays the program's help file: The "Help" button also opens the program's Help window, which has many sections: Help You can access the full list of AutoCAD commands and properties by clicking on the "Help" menu item, or you can use the "Navigation" tab to scroll through sections of the help window: The AutoCAD Help window contains several helpful features. The drop-down menus allow you to sort and search for help documents. The "Online" menu lists documents that are available on the Web. The "Online" tab also lists a list of companies and organizations that provide AutoCAD training, customer support

In versions prior to 2006, third-party modules were provided in two types: RADStudio add-on modules for AutoCAD, AutoCAD LT and AutoCAD Architecture, and Macro-enabled add-on modules for AutoCAD. Third-party modules are now provided through a single add-on format, "ASADD", described below. 3D modeling AutoCAD 2012 In AutoCAD 2012, three-dimensional modeling has been significantly enhanced. While previous versions of AutoCAD had a basic functionality for modeling, AutoCAD 2012 is one of the first tools of its kind to offer a complete toolkit for handling 3D models. The features include import/export functionality and are aimed at completing 3D modeling from other CAD applications. Features of the 3D modeling include: viewport camera features, viewport tracking, light point feature for camera rays, light point feature for rays through hidden geometry and shadow and lighting techniques. 2017 release AutoCAD 2017 introduced numerous major

The first time you launch Autodesk Autocad, you will be asked to create a new template by selecting New Template for this Project. Your new template is now ready to be used to start a new drawing. Editing the templates Creating a new project automatically creates a new Template file. You can edit the template file for various purposes, including changing the name of the template file, removing any shared areas from the template, or changing the default project settings. The changes you make to the template file apply to all the drawings created from the template. To make your changes to the template file, choose New Template File from the Options dialog box and make the changes. Your template file is now ready to be used in a drawing. What is a template? A template is a drawing that can be reused over and over again. Templates are often used to save time. For example, if you are entering data for a building design, you can make changes to the building design, save it as a template, and then use the template to quickly draw different buildings. The use of templates is completely up to you. You can reuse templates as many times as you want to save time. What is a new template file? When you create a new template file, you are creating a new drawing template. This drawing template is different from the initial template file that you created when you started the drawing project. In the initial template file, all the drawing elements were selected and drawn out. If you want to edit the drawing elements, you first have to select the elements from the template file. In a new template file, you draw the elements without selecting them. You can create as many new template files as you like. How do I create a new template file? You can create a new template file in several ways. To create a new template file, choose New Template File from the Options dialog box. Create a new template file by clicking the New Template File button and specifying a filename for the template file. Create a new template file by clicking the New Template File button. If you are prompted for a drawing name, type the name of the drawing to which you want the template to be applied. Create a new template file by selecting a template file from the Project Templates dialog box. Choose a template from the list and then click the New Template File button. Templates A template is a drawing that you can

## **System Requirements:**

Before we get started, I should mention that you need to have a working relationship with the company or agency you're applying with. This is important. If your application isn't accepted or you don't get the job, it's not our fault, it's theirs. If your application is denied or you don't get the job, we want to make sure you didn't get it because you weren't qualified. This means that you must have a working relationship with the company, you must be able to get their contact info, and you must have permission to contact them
