In late 2018, Adobe launched a new generation of users, as it unleashed Photoshop on web browsers and smartphones. Now the company is releasing its latest generation of professional software, Photoshop Elements 2021. This latest version marks a revisit to history for the company; along with its new web-based customers, the application, which is renamed Photoshop Elements, is operating on a Windows and Mac operating system, has a big focus on social media integration, and uses new artificial intelligence technology.

And now for another new element: the camera used to shoot that amazing vacation photo is built into the monitor. It's the same approach that Apple and Google use in their phones and tablets, and it gives the user control over monitor shutdown, the ability to show the live photo feed from the camera, and the ability to interact with and appeal to other viewers on social media. (I do wish the camera could shoot sequences, so that you could even do some video editing online. And to be honest, I don't think I'll be able to wait until 2021 to see that feature.)

With the release of the first technical preview of Photoshop Elements 2021 in mid-October, 2020, the evolution of Adobe's flagship software continues in earnest. The latest release of Elements introduces a variety of new features, from targeted sharpening to a much-improved selection tool and more. This is the first time we're doing a review on the first technical preview, and the first time we've had a full chance to use the software on a smartphone. I will be reviewing two of the most important features that are included in the preview version, unlike the review of Elements 2019 where only the batch processing was tested.

Adobe Photoshop's new features provide state-of-the-art editing functions, raising Photoshop's capability and functionality significantly. With most products on the market, users need to spend time searching around the feature set and trying to learn which features to explore. One of the highlights of Photoshop's new update is the ability to search for assets in both work areas and a huge collection of the world's most popular cloud storage platforms. When the product was announced, the names of new tools and features were not released. The names would be revealed later on. The browser-based application is regarded as a testbed, and things that work there will surely be made available in other products. Nothing has been formally announced yet. However, the features included in this new version do seem to be top priority. While not pinpointed specifically, it seems to be on the radar of earlier developers. One of the best features is smart object recognition. Smart objects flag pieces of an image where fine details like logos can be cropped out automatically. It is a favorite of a variety of professionals as well as hobbyists. Shapes are another of the highlights of this version as they are now automatically stored for each layer's native size/shape in Photoshop. For example, you can select the size of the shape and the software will select the size of the layer. Previously, users had to create a template to ensure crisp edges and sharp corners.
